

MAXMATIC

Accessories

Sink Bushes

We offer both Continuous and Batch Feed sink bushes in a brass or gold PVD finish to match various tap finishes. For thicker sinks the extended sink bushes will accommodate up to a 69mm sink.

Air Switches

The air switch is designed to fit into a sink or the worktop close to the sink for convenience. The air switch is non-electric so it is usable even with wet hands. One push operates the disposer a second switches the unit off.

Disposer Care

The powerful blue foaming action scrubs food, grease and odours, cleaning your waste disposer and drain, leaving a pleasant lemon fresh scent.

MAXMATIC Domestic Waste Disposal Units

The most environmentally-friendly way to dispose of your kitchen waste

Simple to Fit

Environmentally Friendly

Eliminates Smell

Efficient and Hygienic

Safety

All **MAXMATIC** units are  safety approved. This independent body carries out rigorous on-going testing of both the product and our production methods.

Unique to MAXMATIC

Magnitube - Our 'patent applied for' continuous feed control system (4000 and 5000) which provides the safest continuous use by restricting the feed aperture when in operation.

Magnitop plug - Fitted as standard to our 5000 and 3000 models for batch feed operation. There are no direct electrical contacts so they are both safe to use with wet hands.

We now supply our 'Magnitube' with the 5000 so it can be used as batch feed or continuous feed. The Maxmatic 4000 now also comes with 'Magnitube' so there is no need for a wall switch. The more expensive units, say the 5000, have larger motors with high torque start and a cast chrome iron grinding system. They can handle harder waste like fruit stones and small bones.

Type of Feed explained

Batch feed - (**MAXMATIC** 5000 and 3000) - Waste is placed in the unit and then a plug seals the unit off (allowing water to enter). With the tap on, the plug is turned to activate the unit and dispose of the waste. This is the quietest and safest type of disposer. By activating the unit from the sink plug supplied, there is no need for a wall switch, so installation is much quicker and therefore cheaper.

Continuous feed - (**MAXMATIC** 2000, 1500, 1000, Micro and Maximizer) - The unit is started with either a switch on your wall or an air switch, with the tap on, waste is then fed into the unit. A good option if you have larger quantities of waste to dispose of.

Standard Range

De-Luxe Range

Quality and Choice

MAXMATIC waste disposal units have been used in homes world-wide for the past 40 years and have been developed to meet the most up-to-date safety and quality standards.

The **MAXMATIC** range includes Batch and Continuous feed models and the first combined Batch and Continuous feed model. All **MAXMATIC** units have either a grinding or shredding cutter. No sharp knives! The de-luxe (4000 & 5000) models have our commercial cast grinding system, manufactured from 18% Chrome Iron, an extremely tough and durable material. Making them capable of grinding the hardest of waste like fruit stones and bones.

Friendly to your Environment!

Processing food waste through your **MAXMATIC** creates a pulp that mixes with the other solids in your wastewater. At the existing treatment works aeration and other methods are used to safely produce a more recyclable by-product that can be used as a fertilizer.

MAXMATIC disposal unit can help to protect our environment by providing a greener option to the 'Not So Friendly' alternatives:

Landfill increases Biological Oxygen Demand (BOD) which by starving oxygen can devastate local waterways and ecologies. Biological waste decomposition in landfill can produce Methane - a greenhouse gas that can also damage the ozone layer - and acid leachate that can contaminate the soil and groundwater (this is more damaging than raw domestic sewage).

Incinerators are planned to help meet the government's commitment to reduce landfill. Construction on green field sites will increase heavy traffic in local communities and it is unclear how the emissions will affect our health and the environment.

Composting at home cannot be attempted by everyone, proper management is required to avoid health hazards and similar problems associated with landfill. As it can only be used for true green material it leaves behind any 'animal based' or other food waste such as pasta and rice to be disposed of by one of the other methods.

Pig Swill and other methods of returning untreated waste to the food cycle have had devastating consequences in recent years. The outbreaks of Foot and Mouth, BSE and Swine Fever have been linked to untreated food waste being fed to animals.
